Note: Answered by interviewer, after instructions, "It is your job is to select a random (this means any) household. A household is a group of people who presently eat together from the same spot. Start your walk pattern from the start point that has been randomly chosen by your Field Supervisor. Team members must walk in opposite directions to each other. If A walks towards the sun, B must walk away from the sun; C and D must walk at right angles to A and B. Use a 5 / 10 interval pattern to select a household. That is, walking in your designated direction away from the start point, select the 5th household for the first interview, counting houses on both the right and the left (and starting with those on the right if they are opposite each other). Once you leave your first interview, continue on in the same direction, this time selecting the 10th household, again counting houses on both the right and the left. If the settlement comes

to an end and there are no more houses, turn at right angles to the right and keep walking, continuing to count until finding the tenth dwelling."

Question Number: withinwt

Variable Label: Within country weighting factor

Note: This weighting variable adjusts the distribution of the sample based on individual selection probabilities (i.e. based on region, gender, urban-rural distribution, and size of household and enumeration area).

Question Number: combinwt

Variable Label: Multi-country weighting factor

Note: This weighting variable adjusts the distribution of the sample based on individual selection probabilities (i.e. based on region, gender, urban-rural distribution, and size of household and enumeration area) and treats every country as if its sample were the same size. This should be turned on when reporting multi-country results.

The Quality of Democracy and Governance in Benin
Afrobarometer Round 5, 2011

Dates of Fieldwork:	Nov. 16 – Dec. 06, 2011								
Sample size:	1200								
Sampling frame:	2012 population projections developed by Central Bureau of Statistics (INSAE) based on 2002 Census								
Sample universe:	Citizens age 18 years or older, excluding institutions								
Sample design:	Nationally representative, random, clustered, stratified, multistage area probability sample								
Stratification:	Department and urban-rural location								
Stages:	PSUs (from strata/ ZD), start points, households, respondents								
PSU selection:	Probability proportionate to population size (PPPS).								
	<p>Note: There were some deviations between the sample that was drawn in Benin and standard Afrobarometer protocols. Specifically, while the sample was stratified according to standard practices based on Department and urban-rural location, and thus correctly represents the population distribution across strata, there were some anomalies in the selection of the PSUs within each strata. They were not selected from across all Communes within the strata according to PPPS. Rather, within each strata a selection of Communes was non-randomly selected as Secondary Sampling Units (SSUs), and PSUs were then allocated unevenly across each SSU. However, the PSUs allocated to each SSU were then randomly selected using PPPS. Analysts may wish to take account of the additional clustering that occurred and its possible impact on the standard errors in their analysis.</p> <p>As a point of reference, Afrobarometer protocols normally require that:</p> <ol style="list-style-type: none"> 1) SSUs only be used in rural areas 2) SSUs are randomly selected from within each strata 3) Two PSUs are drawn from each SSU. <p>(For full details on standard Afrobarometer sampling protocols, please see Section 5 of the Afrobarometer Round 5 Survey Manual, available at www.afrobarometer.org).</p>

Note:	Although in most respects the Sudan sample matches the expected distributions, the distribution with respect to level of education appears to be somewhat skewed towards higher education levels. The sample and sampling protocols appear to have been implemented correctly, so the source of any anomalies in the education distribution is not clear. Analysts should keep this in mind when interpreting the data.
